STUVIN - Education, research and innovation of science and technical doctoral programmes  
on J. E. Purkyně University in Ústí n.L., reg. n. CZ.02.2.69/0.0/0.0/16\_0002735

## **Objectives**

The aim of the theoretical part is to understand the physical, chemical and biological aspects of aerosol particle capture by green infrastructure in settlements, to understand the theoretical aspects of modeling and measuring the deposition flux of aerosol particles and aerosol particle capture, understanding the impact of climate change on aerosol emissions and their impact on green infrastructure.. The aim of the applied part is to acquire the knowledge needed for measuring and modeling the deposition flux of aerosol particles in green infrastructure, calculating the capture of aerosol particles by green infrastructure in settlements, evaluation of urban green infrastructure in reducing aerosol particles and adaptation to climate change, assessing the impact of aerosol particles on health green infrastructure, proposing measures for the maintenance and creation of urban greenery in areas with different sources of aerosol particulate emissions and proposing technical measures (green roofs and walls suitable for aerosol particulate trapping).

## **Study topics**

1. Basic information about green infrastructure and its role in reducing air pollution.
2. Emissions of aerosol particles into the atmosphere. Characteristics of aerosol particles. Influence of precursor emissions on the concentration of aerosol particles in the atmosphere.
3. Physical, chemical and biological factors influencing the concentration of aerosol particles in the air.
4. Transport of aerosol particles through the atmosphere, dips and outlets of aerosol particles.
5. Atmospheric deposition of aerosol particles. Physical, meteorological and chemical processes leading to the deposition flow of aerosol particles.
6. Atmospheric deposition of aerosol particles on a local and regional scale. Atmospheric deposition of aerosol particles in the Czech Republic and in the world.
7. Micrometeorological methods for measuring the deposition flux of aerosol particles. Gradient method. Eddy covariation method.
8. Modeling of deposition flow and capture of aerosol particles. Resistance models. Aerosol particle transfer models. Calculation of aerosol particle capture.
9. Analysis of urban greenery, its impact on the environment and the values of society.
10. Proposal of measures for maintenance and creation of urban greenery in areas with different sources of aerosol particle emissions and different population densities, including proposal of addition of green infrastructure and technical measures (green roofs and walls, suitable materials for building construction and aerosol particle capture).

11. Planning and care of urban greenery with regard to air pollution by aerosol particles and adaptation to heat and water shortages.
12. Qualitative modeling of scenarios of the effects of changes in the structure and distribution of urban greenery with regard to the sources of aerosol particle emissions, especially from transport and local heating plants.
13. Influence of reduction of precursor emissions on aerosol particle concentrations in the years 2030 to 2100. Projection of reduction of aerosol particle precursors (NOx, NH3 and VOC) in the Czech Republic.
